Package 'shinyShortcut'

October 14, 2022

Title Creates an Executable Shortcut for Shiny Applications

Version 0.1.0

Description Provides function shinyShortcut() that,
when given the base directory of a shiny application, will produce an
executable file that runs the shiny app directly in the user's
default browser. Tested on both windows and unix machines. Inspired
by and borrowing from

shinyShortcut   *Create Shiny App Shortcut*

Description

Creates an executable file that, when ran, will open the co-located shiny app using the user's default
internet browser.

Usage

```
shinyShortcut(shinyDirectory = getwd(), OS = .Platform$OS.type,
  gitIgnore = FALSE)
```

Arguments

shinyDirectory	The top-level directory containing the code and materials for the shiny application. Also where the final shortcut file will be saved.
OS	The operating system that R is being ran on. Must be one of "windows" or "unix".
gitIgnore	If True then all produced files will be added to a .gitignore file in the specified directory (if there is no such file it will be created).

Details

Calling shinyShortcut will write an executable file that will run the shiny app in the user's default
browser. This executable is stored in a created folder named .shiny_run' whilst a shortcut that will
silently run the executable is saved in the home directory as 'shinyShortcut' (this will be a .vbs
script on windows or a .desktop file on unix systems). These files can then be linked to from other
locations such as the user's desktop.

Examples

```
shinyShortcut()
```
